Professional Summary

Software Engineer with a year of production experience **architecting** Micro-Frontend systems, building **Node.js** **microservices**, and shipping fast **React/Angular** apps. While working on an **enterprise HRMS** platform, I managed to cut build times by **30%** and speed up initial page loads by **40%**. My daily workflow relies heavily on **TypeScript** and **Zustand**, and I am very comfortable setting up Module Federation. I also take ownership of the release cycle—maintaining over **95%** test coverage with **Playwright** and handling deployments through **Jenkins pipelines** and **Docker**. Currently, I am exploring ways to bake **AI-assisted** features directly into modern web products.

Sep 2021 – May 2025

Professional Experience

Sporada Secure India Pvt. Ltd.

Coimbatore

Junior Software Engineer - Full Time

July 2025 - Present

- Architected a React and Angular Module Federation–based Micro-Frontend system for an enterprise HRMS serving 5+ independent teams, enabling isolated deployments per domain (attendance, payroll, onboarding) and cutting monolithic build times by **30%** (~8 min → ~5.5 min).
- Automated our entire release process using Jenkins. By setting up a multi-stage CI/CD pipeline that handled everything from linting and testing to Docker builds, I eliminated manual deployments entirely and slashed our rollout time from **45 mins to under 10 mins**.
- Containerised all Angular and Node.js microservice applications using Docker, standardising dev/staging/production environments and eliminating 'works on my machine' issues across a **4-developer team**. Integrated LLM tool calling via Claude Code to automate code reviews.
- Sped up initial page loads by **40%** and fixed UI freezing on older devices by completely overhauling our data handling. I combined virtual scrolling, lazy loading, code-splitting so the app could smoothly render **10K+** records without lagging.
- Led mobile expansion by packaging existing React apps into production Android APKs using Capacitor, eliminating the need for a separate native mobile team; added PWA service worker caching for offline capability in the field.
- Built a full testing pyramid — Playwright unit tests (**95%+ coverage**) and Vitest E2E flows — gated inside Jenkins pipeline stages, preventing untested code from ever reaching staging and reducing regression bugs by ~**60%**.
- Engineered Node.js/Express microservices to manage high-volume trainee records across the group enterprise, using PM2 for process management and OpenTelemetry for distributed tracing and performance observability.
- Developed reusable custom React Hooks and Components (HOC) reducing boilerplate by ~**35%**
- Created and rolled out a centralized monitoring dashboard for bank alarms and vaults, using WebSockets to push instant security alerts and live branch telemetry across multiple sites.

Technical Projects

AGRI LYNX

Feb 2024 – May 2024

React · Node.js · Express · MongoDB · Tailwind CSS · SQL · JWT · REST APIs · Typescript

- Built a full-stack digital marketplace from the ground up to connect farmers directly with buyers. I designed the entire system to handle everything from live product listings and custom order routing down to the final payment verification

- Packaged our entire React, Node.js, and MongoDB stack into Docker Compose. This wiped out the classic '**it works on my machine**' problem and let the team spin up a perfect local environment with a single command.
- Designed JWT-based auth and role-based authorisation supporting **3** concurrent user roles (farmer, buyer, admin) with zero cross-role data leakage.
- Led a team of **3** developers across task decomposition, PR reviews, and sprint planning — shipping the MVP **2** weeks ahead of schedule.

UCER EXAM CELL — Hall Allocation System Sep 2024 – Jan 2025

Angular · Node.js · MySQL · Queue-based processing · Docker

- Designed and built an automated hall allocation engine serving **2,000+** students per exam cycle, replacing a fully manual process and cutting allocation time from ~4 hours to under **5 mins**.
- Implemented a queue-and-threading pipeline for bulk PDF generation across **40+** exam halls, enabling concurrent processing without UI blocking.
- Decomposed allocation logic into modular constraint-solver components (capacity, department, special requirements), making rules independently testable and extensible.

Volunteer

Google Developer Groups (GDG) Coimbatore

Active Member — attend DevFests and contribute to community workshops.

Technical Skills

Frontend

React.js, Angular, TypeScript, JavaScript (ES6+), HTML5, CSS3, Tailwind CSS, Redux, Zustand, Tanstack Query, Vite, Webpack, PWA, WCAG Compliance, WebAssembly (WASM)

Backend

Node.js, Express.js, REST APIs, GraphQL, WebSockets, WebRTC

Databases

MongoDB / Mongoose, MySQL

DevOps & CI

Jenkins (multi-stage pipelines), Docker, Docker Compose, GitHub Actions, PM2, Git

Testing

Cypress (E2E), Vitest, Playwright

Observability

OpenTelemetry, Lighthouse, Performance Metrics, Bundle Analysis

AI & Agents

LLM Tool Calling, Agent Orchestration, Context Window Optimisation, Claude Code, Gemini CLI, OpenAI Codex, Local LLMs

Fundamentals

Microfrontends (Module Federation), System Design (HLD/LLD), DSA, Agile/Scrum, Event-Driven Architecture, Message Queues, Load Balancing, Auth & Authorization

Certifications & Community

IIT FOSSEE Mapathon participant

Contributed to open geospatial data for Indian infrastructure mapping.

Master Classes in Machine Learning and Artificial Intelligence
